

SUBSTITUTE SPECIFICATION
FASTENING DEVICE FOR A RADIATOR

BACKGROUND OF THE INVENTION

5 1. Field of the invention:

The present invention relates to a radiator with a securing device and particularly to a securing device, with which the radiator can keep closely contact with a heat-generating part on a circuit board.

2. Brief Description of Related Art:

10 The central processing unit (CPU) has been designed to provide extremely fast operation speed and, under this circumstance, it results in much more heat being created. Hence, in order to avoid high heat affecting normal operation of the CPU, a more efficient cooling device is required for heat dissipation.

15 The conventional cooling device usually includes a radiator, a cooling fan and a securing device. The cooling fan is disposed on the radiator to induce airflow for convection. The securing device is used to allow the radiator being fixedly attached to the CPU.

Taiwanese Patent Official Gazette No. 562158, entitled "fixing
20 device for cooling fins being joined to a CPU", includes a frame base, a lower plate and a fixing piece. The frame base has a rectangular shape to be disposed on the main board such that the cooling fins can contact the surface of the CPU. The lower plate is disposed beneath the CPU with two posts thereof piercing both the main board and the frame base. The
25 fixing piece is disposed on the cooling fins with two ends thereof engages with the two posts with a screw rod respectively.

However, in order to locate the fixing device of the preceding prior art, a groove has to be provided such that the structure and shape of the radiator is restricted by the fixing device and the cooling area
30 of the radiator is limited. As a result, the heat dissipation efficiency is incapable of being promoted.

Referring to Figs. 1 and 2, another conventional cooling device has a radiator 11 mounted to a base plate 12 with a CPU 13 thereon and the radiator 11 has a locating lug with a through hole 112 at each of four lateral sides of the radiator 11 such the radiator 11 is secured to the base plate 12 by means of all the through holes 112 corresponding to the fixing holes 121 in the base plate 12 and being passed through with screws 141 and a spring 142 being disposed around the screws 141 respectively. Hence, the radiator 11 can keep contact with the CPU 13 against resilient bias force of the spring 142. It can be seen that the spring 142 is pressed between the head of the screw 141 and the locating lug to prevent the engaging holes 112 and the base plate 12 from damage due to excessive fastening force exerting to the screw 141 and prevent the CPU 13 from damage due to the radiator 11 excessively squeezing the CPU 13.

But, a problem of the preceding prior art resides in that the screws 141 and the springs 142 are separately packed while being delivered so that the screws 141 and the springs 142 are easy missing during mounting the radiator 11 to the base plate 12. Moreover, the springs 142 in addition to the screws 141 makes the overall production cost and set-up cost high.

SUMMARY OF THE INVENTION

An object of the present invention is to provide a radiator with a securing device in which the secure device has less components and a locating part thereof has been tempered with heat treatment so that a resilient force can be obtained while the locating part is fastened to the base plate.

BRIEF DESCRIPTION OF THE INVENTION

The detail structure, the applied principle, the function and the effectiveness of the present invention can be more fully understood with

reference to the following description and accompanying drawings, in which:

Fig. 1 is a disassembled perspective view of the conventional radiator with a securing device;

5 Fig. 2 is an assembled perspective view of the conventional radiator with a securing device;

Fig. 3 is a disassembled perspective view of a radiator with a securing device according to the present invention;

10 Fig. 4 is an assembled perspective view of the radiator with securing device according to the present invention; and

Fig. 5 is a side view of the radiator with a securing device according to the present invention.

DETAILED DESCRIPTION OF THE INVENTION

15 Referring to Figs. 3 and 4, a radiator with a securing device according to the present invention includes a radiator 23 and a securing device. The radiator 23 is attached to a base plate 24 with a heat generating unit 241 such as a CPU. The securing device has a locating part 21 is disposed under the radiator 23 to support and locate the
20 radiator 23. The locating part 21 has an opening 211, which has a shape and size corresponding to a base 231 at the bottom of the radiator 23. The shape of the opening 211 is a square shape but it is noted that the square opening 211 is only an example and not a restriction. A secure arm 22 extends radially from four corners of the opening 211 respectively
25 and the secure arm 22 has an engaging hole 221 at the outer end thereof. Further, the secure arm 22 is tempered with heat treatment so that the secure arm 22 has a property of elasticity.

The engaging hole 221 is used for being passed through with a fastener 25, which is a screw shown in Figs. 3 and 4. The base 231 of
30 the radiator is joined with a plurality of cooling fins 232 are fixedly attached to the base 231. Further, a plurality of guide heat pipes 233

penetrate the cooling fins 232 and touch the base 231 horizontally.

When the radiator 23 is secured to the base plate 24, the base 231 of the radiator 23 fits with the opening 211 of the locating part 21 and then the locating part 21 is attached to the base plate 24 with the
5 engaging holes 221 aligning with engaging holes 242 at the base plate 24. The fasteners 25 engage with the engaging holes 221, 242 to allow the radiator 23 is fixedly secured to base plate 24 and the base 231 of the radiator 23 can keep close contact with the heat generating unit 241. In this way, heat from the heat generating unit 241 is transmitted
10 to the radiator 23 properly via the base 231 and heat is dissipated effectively.

Referring to Figs. 3 and 5, Once the fasteners 25 engage with the locating part 21 and the base plate 24, a resilient contact pressure between the radiator 23 and the heat generating unit 241 due to the secure
15 arms 22 being elastic it is capable of preventing the base plate 24, the secure arms 22 or the heat generating unit 241 from damage resulting from excessive fastening force of the fasteners 25.

Because the locating part 21 is disposed under the radiator 23, structure and shape of the radiator 23 is will not be restricted by the
20 locating part. Further, springs, which are used in the conventional device, are not needed in the present invention while the screws are fastened to secure the radiator. Hence, the production cost can be lowered and the deficiency of missing springs and screws can be overcome.

While the invention has been described with referencing to a
25 preferred embodiment thereof, it is to be understood that modifications or variations may be easily made without departing from the spirit of this invention, which is defined by the appended claims.
